

MINGLES.WTF

WEBSITE PRODUCT BRIEF

Brand, content architecture, admin CMS, holder dashboard, Web3 readiness and motion system for the new Mingles website.

NORTH STAR

**Mingles is the collectible identity at the center of everything we build.
Tequila creates real-world value. PVG creates onchain experiments.
Activation connects ownership to the value the ecosystem creates.**

SYSTEM

TEQUILA -> real-world value PVG
-> onchain experiments
ACTIVATION -> ownership
PROTOCOL -> participation

What this website must accomplish

The site is a living brand operating system: public proof outside, holder state inside, and a content backend that MEMO CHIMAL can operate without calling the developer.

The website has four jobs.

NOT THIS PHASE

- No Points economy.
- No Shop or rewards catalog.
- No token page or tokenomics promise.
- No APY, projected yield or fake earnings.
- No constant manual engagement loop just to make the site feel alive.

CURRENT REALITY

- Tequila remains a promise we will fulfill; bottle + collectible cap have real photo/video material.
- Mike Lombard art rework is coming and should be a major news/reveal story.
- PVG is the experiment lab; Gluttons and Outbreak Z are the first visible systems.
- Mingles Protocol remains visibly IN DEVELOPMENT until economics and legal/accounting are closed.
- The new collection has not launched yet; website architecture must survive migration without another redesign.

Keep the brand. Add the machine.

Use the locked 2026 Mingles identity. The interface provides structure; the art provides color and personality.

Core palette

MINGLE CORAL

#E15162

WARM IVORY

#EDED9

WHITE

#FFFFFF

NEAR BLACK

#1D1D1D

Typography + behavior

DISPLAY

Hogfish - short headlines, calls, drops, high-impact moments.
Never long paragraphs.

SYSTEM

GT Pressura Mono - body, labels, status, dates, metadata
and interface structure.

COLOR RULE

Ivory + near-black are infrastructure. Coral is a signal. Secondary
colors belong to art, not permanent UI chrome.

ART HANDLING

- THE BRAND SYSTEM IS QUIET. THE MINGLE IS LOUD.
- Use real Mike Lombard art, existing ApeChain art and legacy PFPs - never AI replacements.
- Public website: ivory/black foundation + large art crops. Holder panel: black/ivory + coral state/action.
- No gradients, glows, bevels or generic “crypto UI” decoration.

A public story with an operational portal.

The nav should reflect what exists now. Experiments lead to PVG. Holder Portal leads to the account/dashboard. Protocol is previewed as a build, not sold as a finished product.

HOME	TEQUILA	ART	STORY	EXPERIMENTS	UPDATES	HOLDER PORTAL
------	---------	-----	-------	-------------	---------	---------------

PUBLIC CONTENT FLOW

SECTION	CONTENT	JOB
HOME	State + proof + current build	Understand Mingles in <30 sec.
TEQUILA	Bottle / packaging / collectible cap / media	Physical proof.
ART	Mike Lombard rework + lineage + reveal	Character IP.
STORY	Events / parties / sponsorships / achievements	Permanent proof of what we did.
EXPERIMENTS	PVG cards: Gluttons / Outbreak Z / next	Hand off to independent PVG site.
UPDATES	News + build log + milestone changes	Fresh, dated information.
HOLDER PORTAL	My Mingles / art versions / future activation	Personal state after login.
PROTOCOL PLACEMENT	Mingles Protocol appears as a high-visibility “IN DEVELOPMENT” module on Home and in Holder Portal. Do not make it a primary nav destination until the system has real rules, contracts and data.	

Home = controlled reveal + live state.

The home page should feel like a living dashboard without looking like a crypto dashboard. State is content.

WORKING HERO COPY

MINGLES IS EVOLVING.

Collectible identity. Real-world tequila. Onchain experiments.

Tequila creates real-world value. PVG creates onchain experiments. Mingles Protocol connects ownership to what we build.

07The Story So Far	08Latest Updates	09Holder CTA

ADMIN RULE Every module above must have: enabled/disabled, sort order, editable heading/body/CTA, media selector, status and optional schedule. A hidden module must collapse cleanly with no blank gap.

Show the promise becoming real.

Tequila and art are the two strongest proof surfaces. They need enough media flexibility to support the real photo/video material already available.

TEQUILA

WE SAID WE WOULD MAKE TEQUILA. WE ARE.

New bottle. Collectible cap. A real-world product built to carry Mingles beyond Web3.

CONTENT

Bottle status / packaging / unboxing / cap collectible / photo galleries / short video / build proof / launch info when real. CTA evolves from FOLLOW THE BUILD -> LAUNCH INFO -> BUY/FIND RETAILER.

ART

A NEW ERA OF MINGLES.

New art direction by Mike Lombard. Same weird DNA. More character, more authorship, a stronger foundation for the brand.

CONTENT

Artist credit / reveal status / selected gallery / collection evolution / lineage. Never frame legacy art as “bad.” Never use AI art as substitute. CTA: FOLLOW THE REVEAL / VIEW NEW ART.

THREE ART VIEWS / HOLDER EXPERIENCE

LEGACY PFP

Original old-collection PFP view.

APECHAIN

Current official ApeChain art.

LOMBARD ERA

Incoming authored character art.

INTERACTION IDEA

Use a controlled “art lineage” scrub / tab / hover reveal so users can move between the three official versions. The transition should demonstrate evolution, not imply that one version was a mistake.

Make the history permanent and the build current.

These are separate content types: STORY proves what Mingles has done; UPDATES shows what Mingles is doing now.

THE STORY SO FAR

Events. Parties. Sponsorships. Collaborations. Achievements. The things we actually shipped.

STORY ENTRY

Admin-selectable type: EVENT / PARTY / SPONSORSHIP / ACHIEVEMENT / COLLAB / COMMUNITY / PRODUCT. Fields: title, date, location, short copy, long copy, hero image/video, gallery, external link, tags, featured, publish state.

UPDATES / BUILD LOG

What changed. What shipped. What comes next.

UPDATE ENTRY

Categories: ART / TEQUILA / PVG / PROTOCOL / MIGRATION / COMPANY. Fields: headline, date, status, 2-5 sentence summary, media, proof link, next action, related progress module, publish/schedule.

WHY BOTH

- Story is curated and evergreen: it should become a visual archive of credibility.
- Updates are chronological and disposable: each one can update a state card or progress bar.
- The admin can promote any entry to Home and remove it later without deleting the source entry.
- Photo + video are first-class content, not attachments hidden at the bottom.

WORKING SECTION COPY

THE STORY SO FAR. / “Mingles has always been built in public - through people, events, experiments and product.”

LATEST UPDATES. / “What is changing, what shipped, and what we are building next.”

PVG is the lab. Mingles Protocol is the bridge.

Do not blur brands. Mingles introduces the experiments; the independent PVG site owns the deep product/game experience.

EXPERIMENTS

WE EXPERIMENT IN PUBLIC.

PVG is where we build and test onchain systems. Gluttons, Outbreak Z and whatever comes next live there.

GLUTTONS

Status + one-line conflict + media + GO TO PVG / LAUNCH when available.

OUTBREAK Z

Status + one-line conflict + media + GO TO PVG / LAUNCH when available.

NEXT EXPERIMENT

Hidden until a real experiment exists. Admin can publish the card; dev is only needed if the actual game is embedded or integrated.

TOKEN GATE A token is not part of V1. It is introduced only if it solves a necessary job that the protocol cannot solve cleanly without it.

MINGLES PROTOCOL

IN DEVELOPMENT

Activation is the bridge between owning a Mingle and participating in the value created across the ecosystem.

The website should reserve the system surface now, but publish economics only when the rules are real. No token assumption. No Points. No fake yield.

BUILDING

NOT LIVE

Your Mingles. Your state.

The dashboard must work before Activation exists. It starts as ownership + art + migration state, then grows into Activation and distributions when those systems are ready.

OVERVIEW

MY MINGLES

EXPERIMENTS

ACTIVATION

DISTRIBUTIONS

ACCOUNT

MY MINGLES

Owned count + selected Mingle + art version tabs + provenance/migration state.

EXPERIMENTS

CMS-driven cards inside dashboard: image/video, title, description, status, CTA label + URL/route. External games can launch without a site deploy.

PROTOCOL STATE

Activation: BUILDING / NOT LIVE until enabled. Future distributions show source, period, status and amount only when real.

MY MINGLE DETAIL

- Token ID / ownership status / linked wallet.
- Three official art views where available: Legacy PFP / ApeChain / Mike Lombard.
- Migration / provenance status when the new collection is ready.
- Experiment eligibility or links only when a rule actually exists.
- Activation status and distribution history are future-ready modules; hidden or “Building” before launch.

GAME CARD RULE

- Admin can add/edit card metadata and media.
- Admin chooses PUBLIC, HOLDER or BOTH visibility.
- CTA types: LEARN MORE / GO TO PVG / LAUNCH / WATCH / ARCHIVED.
- Developer required only for game logic, wallet transactions, contract calls or embedded interactive routes.
- Card layout is fixed so new games do not require redesign.

LANGUAGE Front-end vocabulary stays simple: Your account / My Mingles / Available now / Building / Launch / View history. Web3 mechanics stay underneath unless a transaction truly requires explanation.

MEMO CHIMAL should operate the site without Carlos.

The admin panel is a core product requirement, not an afterthought. Routine content changes must not require code, Git, deploys or developer availability.

GLOBAL COPY

Edit navigation labels, headings, paragraphs, CTA labels, footer text, notices and section copy. Every visible text block must have a stable editable record.

MODULE CONTROL

Enable/disable, reorder, feature/unfeature, schedule publish/unpublish, choose media and update status for every modular section.

MEDIA LIBRARY

Upload images + video, title/alt/caption/poster, reuse across entries, replace assets without code. Supabase Storage underneath.

STORY + NEWS

Create events, parties, sponsorships, achievements, collaborations and updates with rich media. Draft -> preview -> publish.

PROGRESS

Create/edit progress bars: label, % (optional), status, description, next milestone, proof media, updated date and visibility.

EXPERIMENTS

Create cards for Gluttons, Outbreak Z and future systems: media, status, description, CTA, target URL/route, public/holder visibility.

ADMIN ROLE MEMO CHIMAL = SUPER ADMIN / CONTENT OWNER. Future roles may include EDITOR and DEVELOPER, but V1 must give Memo full content authority without exposing secrets, private keys or contract-admin credentials.

QUALITY OF LIFE

- Preview before publish.
- Revision history / audit log.
- Auto-save drafts.
- Required field validation
- Safe media limits + recommended aspect ratios.

Build the shell once. Feed it structured content forever.

Use typed content records instead of hardcoding pages. The same content can surface on Home, its section page and Holder Portal without duplication.

MODEL	PURPOSE	CORE FIELDS
site_copy	Global/site text	key, page, section, field, value, locale, updated_at
page_sections	Modular page blocks	page, module_type, enabled, sort_order, variant, copy refs, media refs
story_entries	Permanent history	type, title, date, location, body, media, tags, featured, status
updates	Build log/news	category, headline, date, status, summary, media, proof, next_action
progress_items	Visible build state	label, status, percent?, description, next_milestone, updated_at, enabled
experiments	PVG/game cards	title, status, media, description, CTA label, target, visibility, featured
media_assets	Reusable media library	file, type, alt, caption, poster, dimensions, duration, metadata
mingle_art_versions	Art lineage references	token_id, version_type, asset_ref, status, active/display flags
admin_audit_log	Accountability	admin_id, action, entity, before/after, timestamp

RENDERING RULE Front end renders by module type + layout variant. Content changes update data; they do not change component code. New visual component types still require Carlos, but new content inside approved types does not.

Supabase as source of truth; Next.js as the product shell.

Recommended V1 architecture is simple, modular and maintainable - a headless/JAMstack-style application without introducing a second CMS unless the team later needs it.

SECURITY REQUIREMENTS

- Enable Postgres RLS on all exposed tables; admin write policies require authenticated role/claims.
- Storage uploads go through Supabase Storage APIs with RLS; no service-role key in browser.
- Admin UI and holder portal are separate authorization concerns: content admin does not imply contract admin.
- Validate/sanitize rich text and outbound links. Restrict file types and upload sizes.
- Maintain audit log for publish, delete, copy and progress changes.
- Secrets live server-side; wallet/signature flows use nonce + replay protection.

PERFORMANCE / DATA

- Cache public CMS reads; invalidate on publish.
- Lazy-load video, Rive and WebGL. Never block first paint on decorative motion.
- Generate responsive images/posters; prefer optimized media delivery.
- Use Realtime only where true live state adds value; do not make ordinary CMS content websocket-dependent.
- Build graceful fallbacks for unavailable RPC/indexer data.
- No fake “live” counters. If data is stale, show last updated time.

REFERENCE

Supabase official documentation supports Storage with fine-grained access control and Postgres RLS; this brief treats RLS and server-side secrets as non-negotiable production requirements.

Design for Activation later without pretending it exists now.

The database, components and holder routes should be extensible so the future Protocol can arrive without rebuilding the public website.

V1 holder state

- Canonical user + linked wallet(s).
- Owned Mingles from the current official contract(s).
- Migration/provenance status when available.
- Art version references and reveal state.
- Experiment cards and external/embedded launch routes.
- Protocol status = BUILDING / NOT LIVE.

Future Activation state

- active / inactive / not available
- activation period / epoch
- eligible systems
- source allocations
- distribution records / claim state
- transfer reset behavior if adopted
- token role only if later approved

FUTURE VALUE FLOW / RESERVED, NOT PROMISED

LOCK No Points. No Shop. No token requirement. The site should make these omissions feel intentional, not unfinished. Protocol surfaces are designed as state containers that can become functional when rules are approved.

LEGAL / ACCOUNTING GATE Any holder participation tied to experiment revenue or tequila sales must be reviewed before launch for exact accounting basis, disclosures, tax and jurisdiction-specific legal treatment. The website must not imply a fixed return before that work is complete.

The wow factor comes from behavior, not decoration.

Use motion to explain state, reveal art and reward intent. Keep the experience technological and surprising without sacrificing speed, readability or Mingles brand discipline.

CURSOR / POINTER

Subtle follow-cursor lens, magnetic CTAs, image parallax or art crop response on desktop. Never required for navigation.

SCROLL STATE

State rail reacts to section position. Progress/milestone bars animate to stored values. Scroll-linked art reveal where it tells a story.

ART REVEAL

Clip-path/mask transitions between Legacy, ApeChain and Lombard views. Hover/tap reveals; no full-screen gimmick required.

LIVE PULSE

New update / live experiment / changed status gets a small pulse and timestamp. Numbers animate only when data changed.

RECOMMENDED TOOLING / 2026

TOOL	JOB
Motion for React	Default microinteractions, pointer response, scroll-linked/parallax, reduced-motion friendly. Official docs use native ScrollTimeline where possible.
GSAP + ScrollTrigger	Use only for complex hero/section choreography, pin/scrub sequences or difficult timelines.
Rive	Optional 1-2 authored interactive brand moments/state-machine illustrations - not a replacement for Mike art.
CSS / View Transitions	Use native transitions where production-ready in target browser matrix; Motion is the fallback/control layer.
Three.js / WebGL	Optional special surface only if it adds meaning. Lazy-load and provide static/mobile fallback.

NON-NEGOTIABLE MOTION RULES

No scroll-jacking. No glitch for glitch’s sake. Respect prefers-reduced-motion. Touch/mobile gets equivalent intent without cursor effects. Motion must clarify hierarchy, state, lineage or progress.

Ship the content system first; layer protocol functionality later.

Carlos should be able to hand this brief to an implementation AI and build the final product without inventing missing economics.

PHASE	SHIP	GATE
PHASE 1 / SHELL	Home + Tequila + Art + Story + Experiments + Updates + Protocol preview	Admin can fully operate content.
PHASE 2 / PORTAL	Auth + My Mingles + three art views + migration/provenance state + experiment cards	No fake Activation.
PHASE 3 / PROTOCOL	Activation + distributions only after economics, contracts, legal/accounting are locked	Data model already ready.
PHASE 4 / TOKEN GATE	Token/AMM only if it has a necessary job	Not a website dependency.

ACCEPTANCE CRITERIA

- MEMO CHIMAL can change any normal site copy without editing code.
 - Admin can create, edit, preview, publish, unpublish and reorder Story, Updates, Progress and Experiment content.
 - Admin can upload/reuse images and video and control hero/poster/caption/alt text.
 - Progress bars and state labels are data-driven and can be hidden; no hardcoded fake percentages.
 - Adding a new external PVG/game card requires no deploy; adding game logic still requires developer work.
- Holder portal can show current ownership even if Activation is not live.
 - All three official art eras can be represented without changing site architecture.
 - Mobile works first-class; reduced-motion and keyboard paths are preserved.
 - Public pages do not require wallet connection to understand current state.
 - No Points / Shop / token narrative appears unless explicitly re-approved later.

DEFINITION OF DONE

The new site should feel more alive every time Memo publishes - without Carlos having to touch layout code. The product is not only the website; the admin content system is part of the website.

Instructions for Carlos + implementation AI.

This page prevents the build from drifting back toward old Points/Shop logic or generic crypto-dashboard design.

DO

- Preserve the exact North Star and brand architecture in this brief.
- Use real Mingles assets and real status data; placeholders may exist in development but never ship as fake proof.
- Build pages from reusable modules backed by Supabase records.
- Make all normal copy and media editable from Admin.
- Keep PVG independent while allowing Mingles to surface experiment cards and states.
- Design Protocol as an expandable state surface, not a simulated financial product.
- Use motion as a functional layer: reveal, state, pointer intent, progress and transitions.

DO NOT

- Do not restore Mingles Points, Shop, reward catalog or old membership-first architecture.
- Do not invent token utility, yield, revenue share percentages or Activation economics.
- Do not hardcode events, news, milestones, progress or experiments into components.
- Do not use AI bottle renders or AI Mingles as content substitutes.
- Do not make wallet connection the entry point to the public site.
- Do not turn every section into a black neon crypto dashboard.
- Do not require a developer for routine content maintenance.

SOURCE BASIS

Mingles North Star 2026; Mingles Brand Identity 2026; Mingles Website Concept UI/UX v2; Mingles Website Content Blueprint v2; Mingles Migration Intention & Plan; Mingles v2 NFT Migration Protocol Plan; PVG Master Operating Doctrine v2; StonkBrokers and TokenWorks protocol studies. Technology guidance cross-checked against official Motion, GSAP, Rive, Next.js, Supabase and Three.js documentation in September 2026.

FINAL PRODUCT LAW

MINGLES.WTF = BRAND PROOF + PUBLIC STATE + EDITORIAL HISTORY + HOLDER OS. BUILD THE SHELL ONCE. LET MEMO KEEP IT ALIVE.
